# Linear Lists And Trees

---

- Linear lists are useful for serially ordered data.
  - (e0, e1, e2, ..., en-1)
  - Days of week.
  - Months in a year.
  - Students in this class.
- Trees are useful for hierarchically ordered data.
  - Employees of a corporation.
    - President, vice presidents, managers, and so on.
  - Java's classes.

● Object is at the top of the hierarchy.

● Subclasses of Object are next, and so on.

# Hierarchical Data And Trees

---

- The element at the top of the hierarchy is the **root**.
- Elements next in the hierarchy are the **children** of the root.
- Elements next in the hierarchy are the **and children** of the root, and so on.
- Elements that have no children are

▪

# Definition

---

- A tree is a finite nonempty set of elements.
- One of these elements is called the **root**.
- The remaining elements, if any, are partitioned into trees, which are called the subtrees of **t**.

# Caution

---

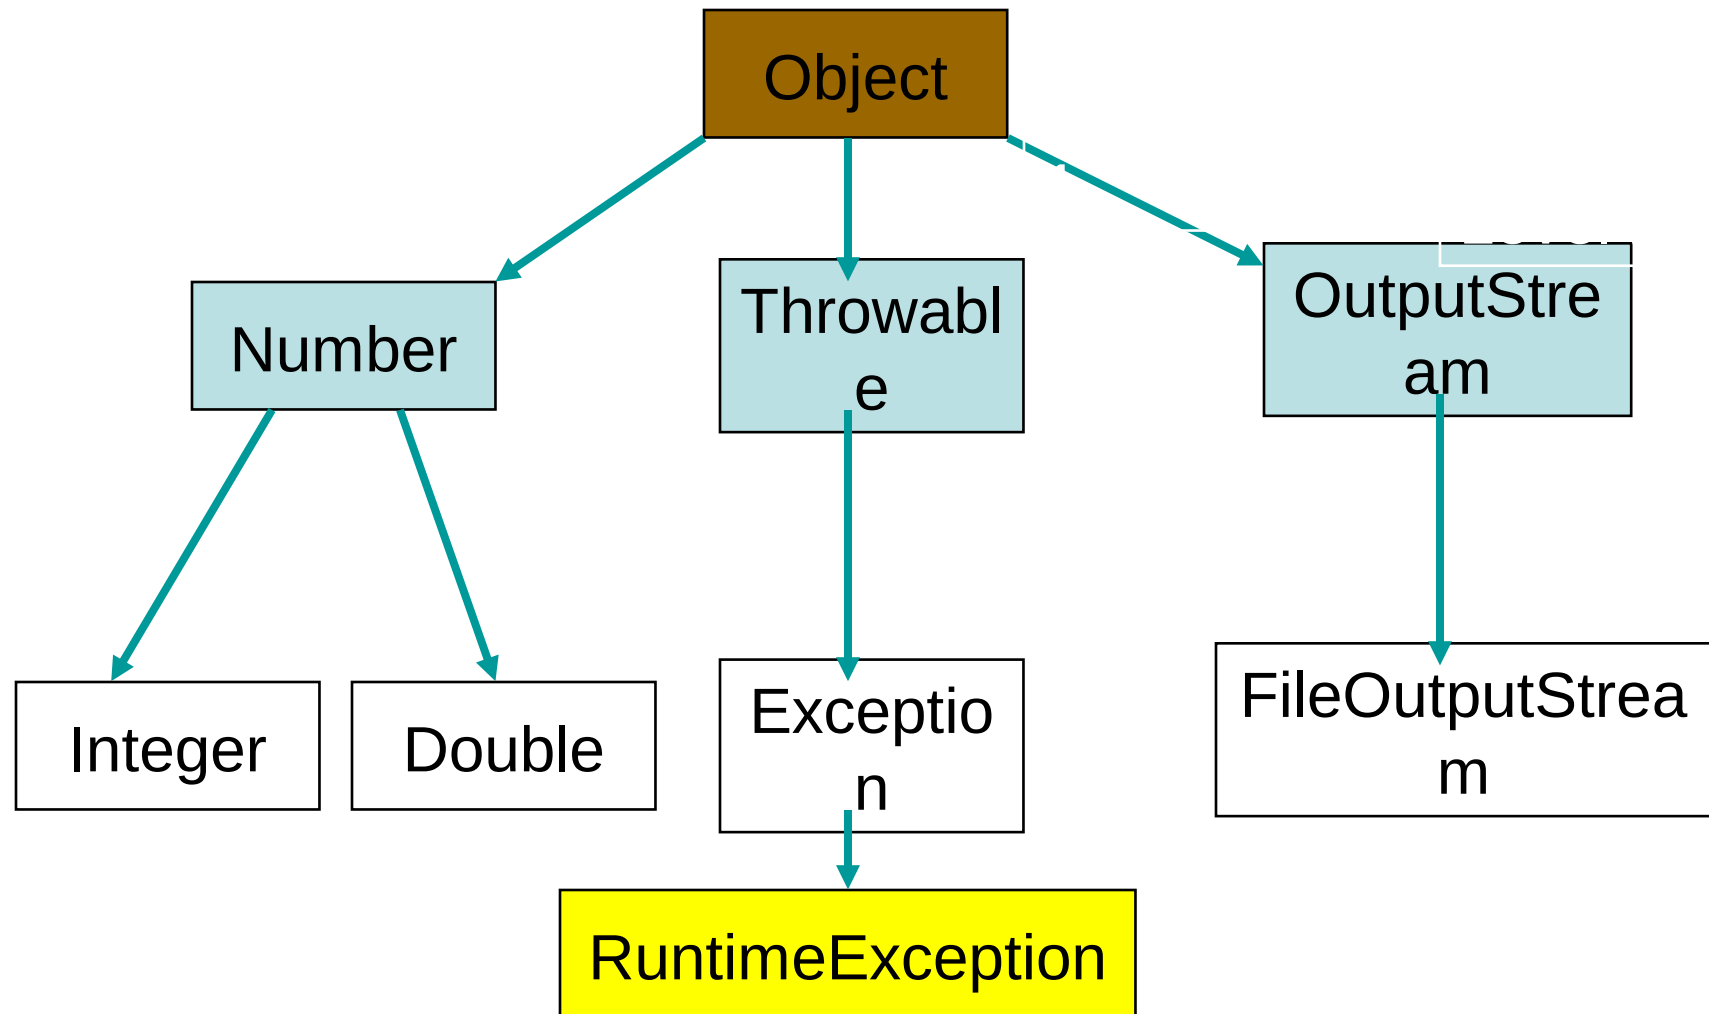

- Some texts start level numbers at 0 rather than at 1.
- Root is at level 0.
- Its children are at level 1.
- The grand children of the root are at level 2.
- And so on.
- We shall number levels with the root at level 1.

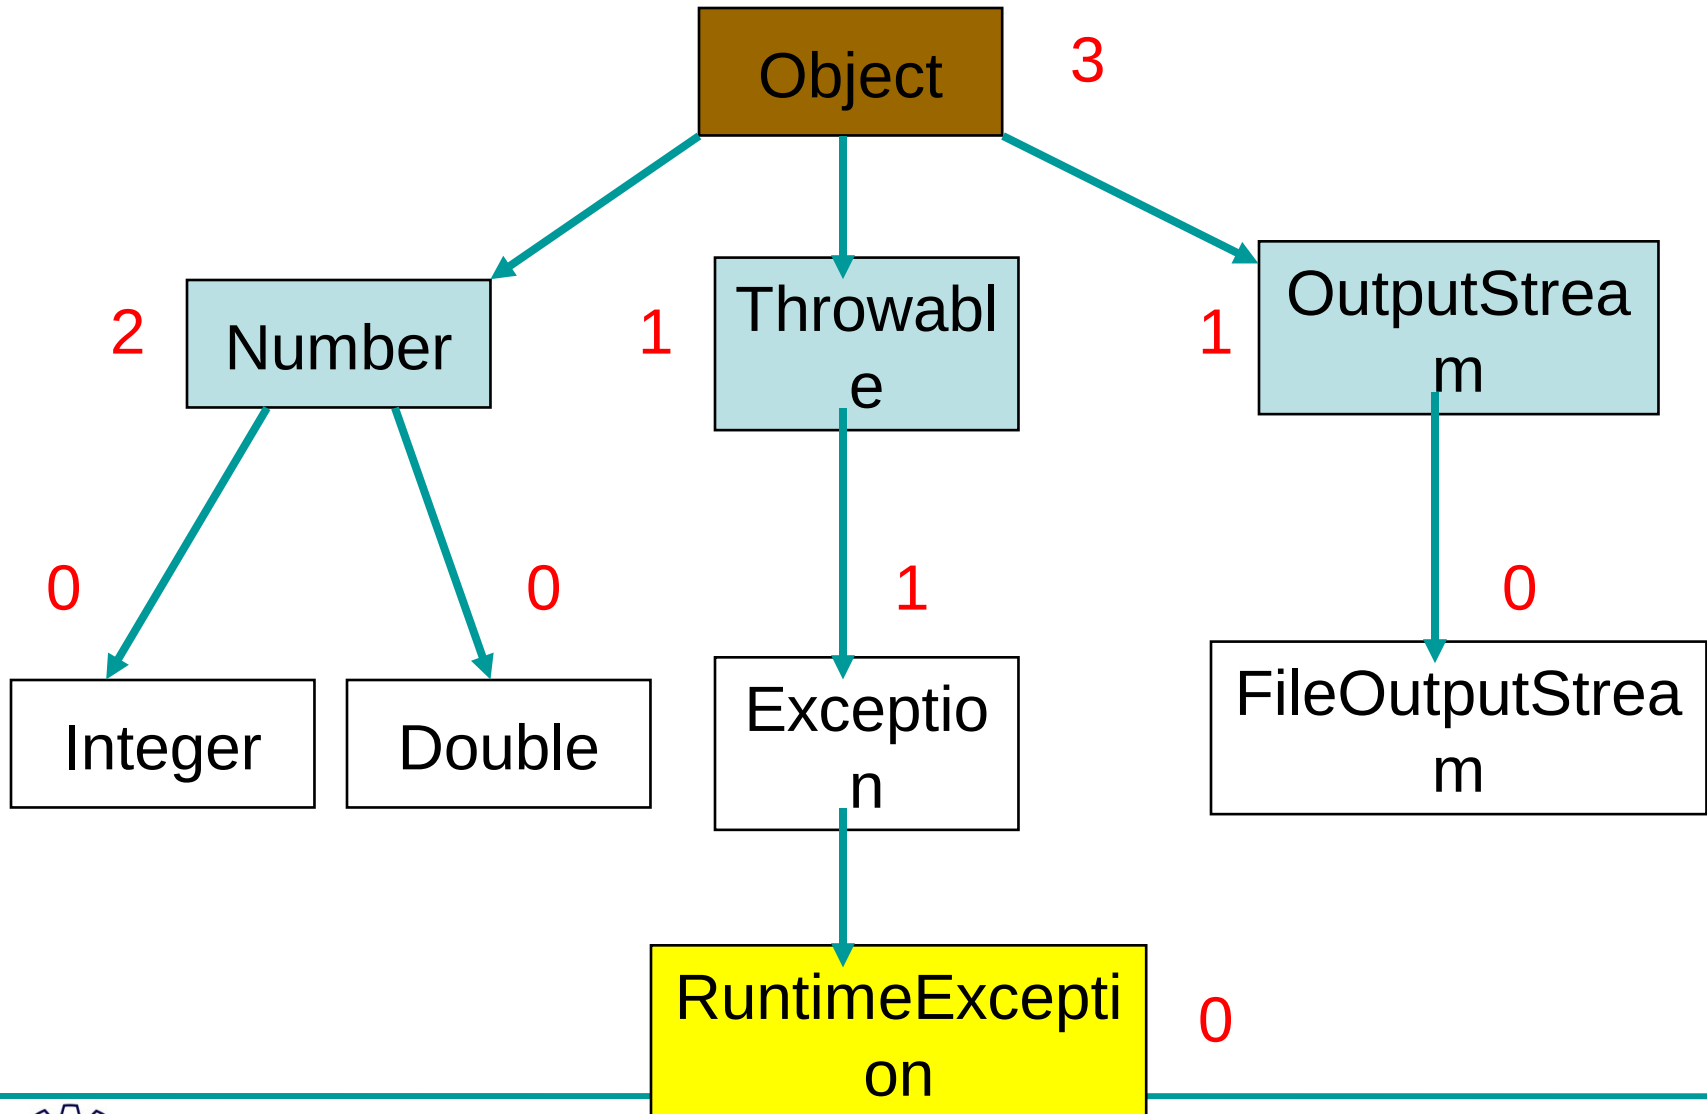

# height = depth = number of levels

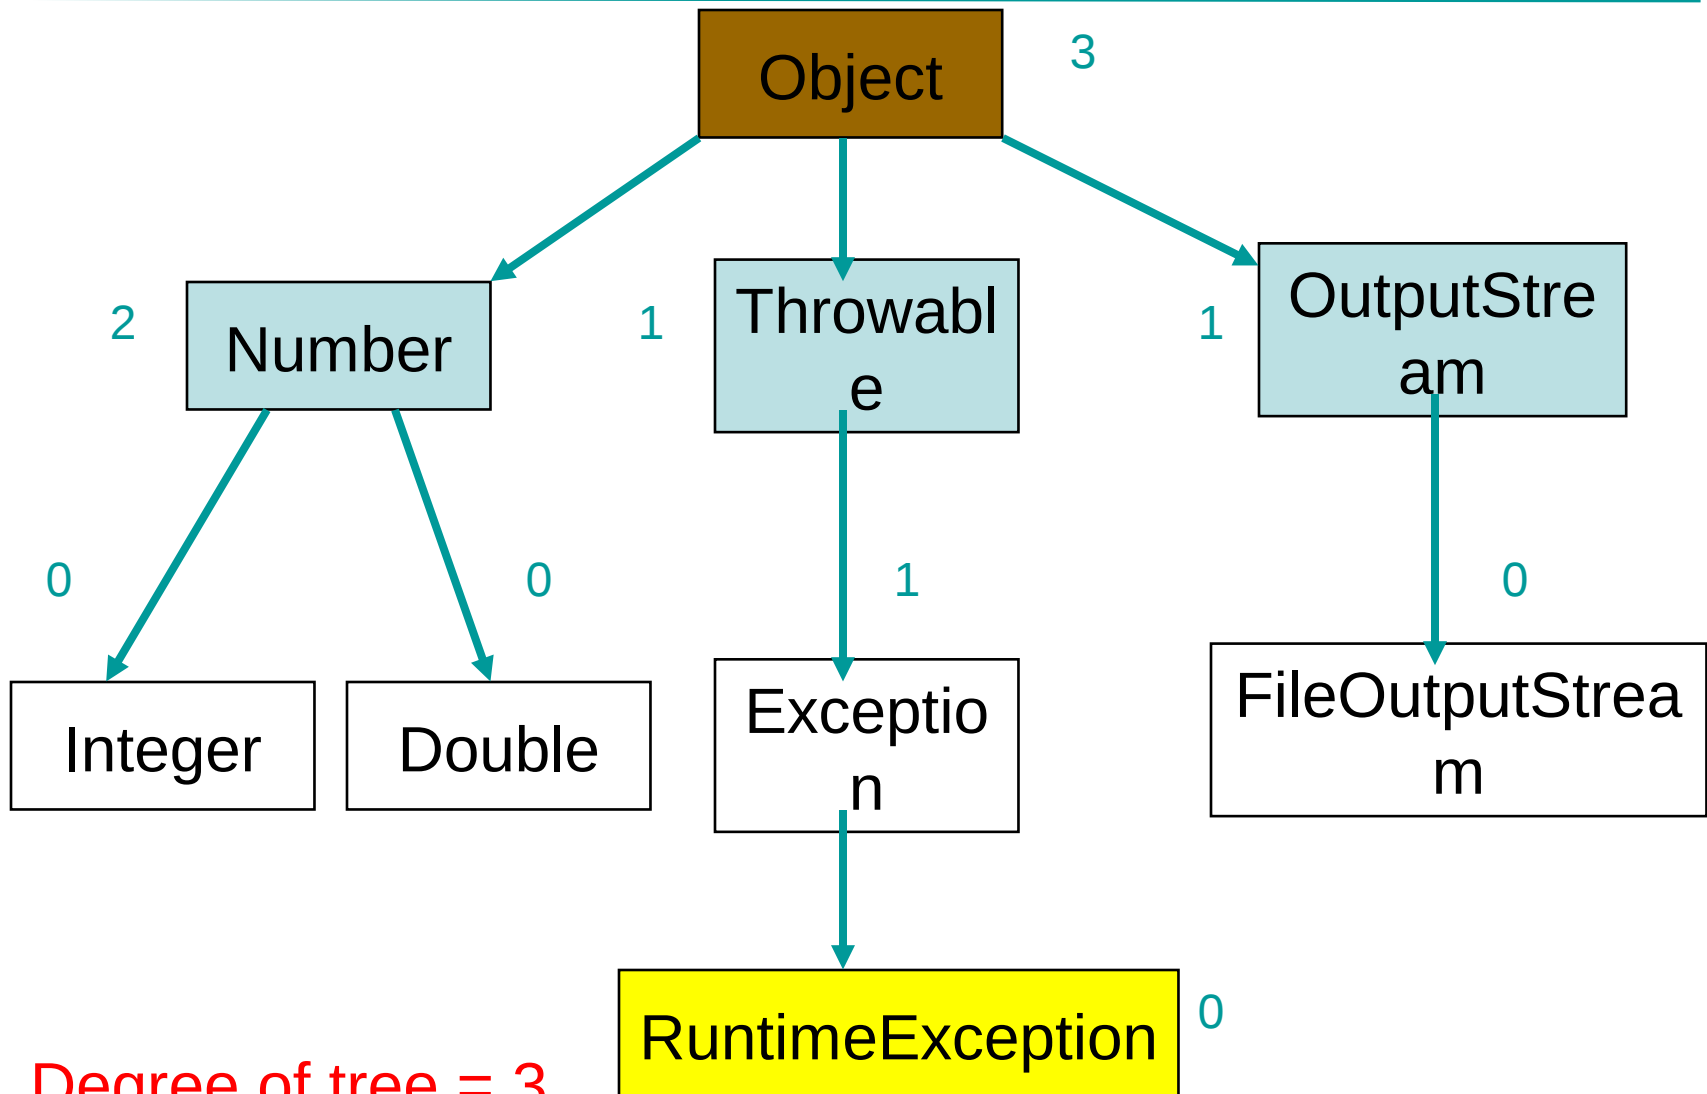

---

# Node Degree = Number Of Children

# Tree Degree = Max Node Degree

# Binary Tree

---

- Finite (possibly empty) collection of elements.
- A **nonempty** binary tree has a **root** element.
- The remaining elements (if any) are partitioned into **two** binary trees.
- These are called the **left** and **right** subtrees of the binary tree.

# Differences Between A Tree & A Binary Tree

---

- No node in a binary tree may have a degree more than **2**, whereas there is no limit on the degree of a node in a tree.
- A binary tree may be empty; a tree cannot be empty.

# Differences Between A Tree & A Binary Tree

---

- The subtrees of a binary tree are ordered; those of a tree are not ordered.

- Are different when viewed as binary trees.
- Are the same when viewed as trees.

# Arithmetic Expressions

---

- $(a + b) * (c + d) + e - f/g * h + 3.25$
- Expressions comprise three kinds of entities.
  - Operators (+, -, /, \*).
  - Operands (a, b, c, d, e, f, g, h, 3.25, (a + b), (c + d), etc.).
  - Delimiters ((, )).

# Binary Tree Properties & Representation

---

# Minimum Number Of Nodes

---

- Minimum number of nodes in a binary tree whose height is  $h$ .
- At least one node at each of first  $h$  levels.

minimum number of nodes is  $h$

# Maximum Number Of Nodes

- All possible nodes at first  $h$  levels are present.

Maximum number of nodes

$$= 1 + 2 + 4 + 8 + \dots + 2^{h-1} = 2^h - 1$$

# Number Of Nodes & Height

---

- Let  $n$  be the number of nodes in a binary tree whose height is  $h$ .
- $h \leq n \leq 2^h - 1$
- $\log_2(n+1) \leq h \leq n$

# Full Binary Tree

- A full binary tree of a given height  $h$  has  $2^{h+1} - 1$  nodes.

Height 4 full binary tree.

# Numbering Nodes In A Full Binary Tree

---

- Number the nodes **1** through  **$2^h - 1$** .
- Number by levels from top to bottom.
- Within a level number from left to right.

# Node Number Properties

---

- Parent of node  $i$  is node  $i / 2$ , unless  $i = 1$ .
- Node  $1$  is the root and has no parent.

# Node Number Properties

---

- Left child of node  $i$  is node  $2i$ , unless  $2i > n$ , where  $n$  is the number of nodes.
- If  $2i > n$ , node  $i$  has no left child.

# Node Number Properties

---

- Right child of node  $i$  is node  $2i+1$ , unless  $2i+1 > n$ , where  $n$  is the number of nodes.
- If  $2i+1 > n$ , node  $i$  has no right child.

# Complete Binary Tree With $n$ Nodes

---

- Start with a full binary tree that has at least  $n$  nodes.
- Number the nodes as described earlier.
- The binary tree defined by the nodes numbered  $1$  through  $n$  is the unique  $n$  node complete binary tree.

# Example

---

- Complete binary tree with 10 nodes.

# Binary Tree Representation

---

- Array representation.
- Linked representation.

# Array Representation

- Number the nodes using the numbering scheme for a full binary tree. The node that is numbered  $i$  is stored in `tree[i]`.

# Right-Skewed Binary Tree

---

tree[]     a - b - - - c - - - - - d

- An **n** node binary tree needs an array whose length is between **n+1** and **2n**.

# Linked Representation

---

- Each binary tree node is represented as an object whose data type is **BinaryTreeNode**.
- The space required by an **n** node binary tree is  **$n * (\text{space required by one node})$** .

# Linked Representation Example

---

leftChild  
element  
rightChild

# Binary Tree Traversal

---

- Many binary tree operations are done by performing a **traversal** of the binary tree.
- In a traversal, each element of the binary tree is **visited** exactly once.
- During the **visit** of an element, all action (make a clone, display, evaluate the operator, etc.) with respect to this element is taken.

# Binary Tree Traversal Methods

---

- Preorder
- Inorder
- Postorder
- Level order

# Preorder Example (visit = print)

---

a b c

# Preorder Example (visit = print)

---

a b d g h e i c f j

# Inorder Example (visit = print)

---

b a c

# Inorder Example (visit = print)

---

g d h b e i a f j c

# Inorder By Projection (Squishing)

---

g d h b e i a f j c

# Postorder Example (visit = print)

---

b c a

# Postorder Example (visit = print)

---

g h d i e b j f c a

# Traversal Applications

---

- Make a clone.
- Determine height.
- Determine number of nodes.

# Level-Order Example

---

a b c d e f g h i j

# Binary Tree Construction

---

- Suppose that the elements in a binary tree are distinct.
  - Can you construct the binary tree from which a given traversal sequence came?
  - When a traversal sequence has more than one element, the binary tree is not uniquely defined.
  - Therefore, the tree from which the sequence was obtained cannot be reconstructed uniquely.
- 

# Binary Search Trees

---

- Dictionary Operations:
  - `get(key)`
  - `put(key, value)`
  - `remove(key)`

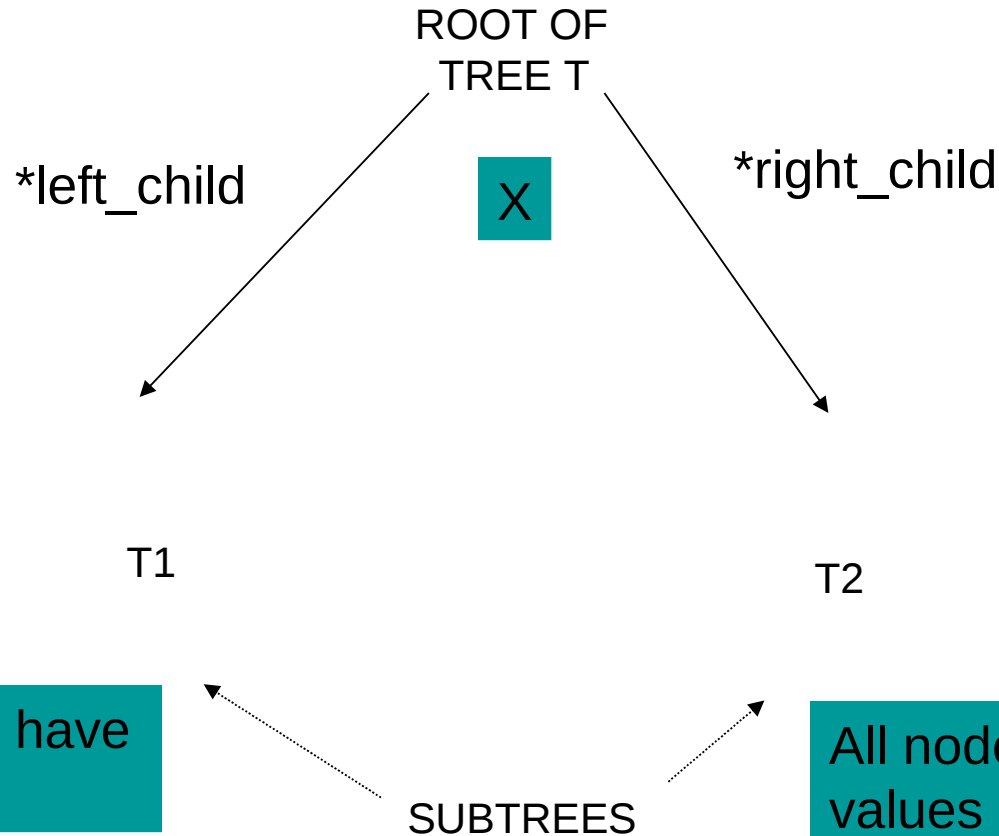

# Complexity Of Dictionary Operations

Data Structure	Worst Case	Expected
Hash Table	$O(n)$	$O(1)$
Binary Search Tree	$O(n)$	$O(\log n)$
Balanced Binary Search Tree	$O(\log n)$	$O(\log n)$

$n$  is number of elements in dictionary

# Binary Search Tree

# Definition Of Binary Search Tree

---

- A binary tree.
- Each node has a (key, value) pair.
- For every node  $x$ , all keys in the left subtree of  $x$  are smaller than that in  $x$ .
- For every node  $x$ , all keys in the right subtree of  $x$  are greater than that in  $x$ .

# Example Binary Search Tree

---

Only keys are shown.

# The Operation get()

---

Complexity is  $O(\text{height}) = O(n)$ , where  $n$  is number of nodes/elements.

# The Operation put()

---

Put a pair whose key is **35**.

# The Operation put()

---

Complexity of put() is  $O(\text{height})$ .

# The Operation remove()

---

Three cases:

- Element is in a leaf.
- Element is in a degree 1 node.
- Element is in a degree 2 node.

# Remove From A Leaf

Remove a leaf element. key = 7

# Remove From A Degree 1 Node

---

Remove from a degree **1** node. key = **40**

# Remove From A Degree 1 Node

---

Remove from a degree 1 node. key = 15

# Remove From A Degree 2 Node

---

Remove from a degree 2 node. key = 10

# Remove From A Degree 2 Node

---

Replace with largest key in left subtree (or smallest in right subtree).

# Remove From A Degree 2 Node

---

Replace with largest key in left subtree  
(or smallest in right subtree).

# Remove From A Degree 2 Node

---

Replace with largest key in left subtree  
(or smallest in right subtree).

# Remove From A Degree 2 Node

---

Largest key must be in a leaf or degree **1** node.

# Another Remove From A Degree 2 Node

---

Remove from a degree 2 node. key = 20

# Remove From A Degree 2 Node

---

Replace with largest in left subtree.

# Remove From A Degree 2 Node

---

Replace with largest in left subtree.

# Remove From A Degree 2 Node

---

Replace with largest in left subtree.

# Remove From A Degree 2 Node

---

Complexity is  $O(\text{height})$ .

# Analysis

---

- The running time of these operations is  $O(d)$ , where  $d$  is the depth of the node containing the accessed item.
- What is the **average depth** of the nodes in a binary search tree? It depends on how well balanced the tree is.
